6th Annual Workshop
May 15, 2023

Comments

- Really clear and interesting contribution, especially with the inclusion of Cost-Benefit Analysis.
- Are good low infection areas a good counterfactual for high infection areas?
 - ▶ Only a few socioeconomic variables are compared.
- The empirical strategy resembles Bleakley (2007) and Jayachandran & Lleras-Muney (2009).
 - ▶ It would be interesting to show the correlation between baseline infection rates and infection rates reductions after deworming.

Comments

- It would be good to see more robustness checks.
- Have you tried using a continuous DiD approach?
- Some estimates present pre-trends: try using Rambachan & Roth (2023).
